

Task 2

Use the endpoint `/api/2/auth` instead of `/api/auth` to generate an `accessToken` .

This will return an additional property `expires` with the response, which defines the time at which tokens will expire and need to be regenerated. Tokens expire 3 seconds after generation.

```
{
  token: "some-access-token",
  expires: 1694568718449
}
```

The `expires` property is a [Unix timestamp](#) that measures the number of milliseconds since 1 January 1970. `Date.now()` returns a timestamp in the same format.
